Basic and Advanced Life Support, Good Clinical and Laboratory Practices

INITIATED BY

**Tamilnadu DR.MGR Medical
University, Guindy, Chennai,
Tamilnadu**

TRAINING PARTNER

**Society for Emergency
Medicine India**

Foreword

Dr. K. Narayanasamy, M.D., D.M.(Gastro),
Vice-Chancellor
The Tamilnadu Dr. M.G.R. Medical University

The University has around 45 medical colleges under its affiliation with post graduate courses and 2500 post graduate student both broad and super specialty students annually. All students undergo training for Basic and advanced Life Support in their respective colleges as it is mandated by NMC before taking their exam. But the facilities available in each college are different and the trained faculties also differ.

To bring about uniformity modules have been brought about by the University for the Post graduate students for training in Basic and Advanced Life support and to bring about Ethical and good practices in both clinical and Laboratory. (**BLS, ALS, GLP, GCP**)

This is a decentralized program so that the entire Tamilnadu state is covered. This will ensure the complete and uniform module for the 4 training programs FOR THE Post graduate students (both Broad and Super Speciality) of this University.

I take this opportunity to thank Society of Emergency Medicine of India and Tamilnadu Apex Skill Development centre for Healthcare for extending their hands to help us in the module preparation as a part of the MOU signed between them and University respectively.

I wish this training a grand success and sure that this will be a useful tool for the students to help the patients at any emergency and to keep up to good ethical practices both clinical and practically.

A handwritten signature in black ink, appearing to be 'K. Narayanasamy', with a long, sweeping horizontal line extending to the right.

SEMI Partners with The Tamil Nadu Dr. M.G.R. Medical University to Strengthen Life Support Training

The Society for Emergency Medicine India (SEMI), a premier professional body dedicated to advancing emergency medicine and life support protocols in India, has entered into a Memorandum of Understanding (MoU) with The Tamil Nadu Dr. M.G.R. Medical University, one of the largest health sciences universities in the country, to enhance and standardize training in life support, Good Clinical Practices, and Good Laboratory Practices through an integrated two-day program for postgraduate and super-specialty medical students. This initiative will be extended to undergraduate medical and other paramedical specialties, including Nursing, Pharmacy, Allied Health Sciences, Ayurveda, and Dental studies. It will cover all medical students from the affiliated colleges under the aegis of The Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai. This partnership aims to elevate emergency care competencies by standardizing training across medical institutions in Tamil Nadu and beyond.

A Memorandum of Understanding was ceremonially signed in the presence of Thiru Ma. Subramanian, Honourable Minister for Health & Family Welfare, Government of Tamil Nadu and Pro-Chancellor of The Tamil Nadu Dr. M.G.R. Medical University, and Dr. K. Narayanasamy, Vice-Chancellor of The Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai.

The occasion was a high-profile launch event for the BLS/ALS/GCP/GLP program held in the Silver Jubilee Auditorium on the University campus, graced by distinguished dignitaries. Both leaders emphasized the importance of standardized life support training in strengthening emergency care services and medical education. Their presence highlighted the Government's and academic institutions' commitment to integrating this collaborative program into the broader medical education ecosystem.

Hon. Health Minister Thiru M.A. Subramanian and Prof. Dr. K. Narayanasamy, Vice-Chancellor of The Tamil Nadu Dr. M.G.R. Medical University, at the MoU signing event.

SEMI's Vision and Role

SEMI has long championed structured education and skill-based training in emergency medicine. By creating standardized courses such as National Basic Life Support (NBLS) and National Cardiac Life Support (NCLS), SEMI has sought to systematize resuscitation training nationwide, filling gaps in clinical preparedness and emergency response. These courses are designed to ensure healthcare professionals can respond effectively to life-threatening emergencies, bridging the knowledge and skills gap that often exists in high-stress clinical environments. Through collaborations and educational outreach, SEMI promotes emergency medicine as a recognized specialty with consistent training standards across India.

SEMI Delegation

The SEMI board representing the Society at the event included:

Dr. Sowjanya Patibandla – National President

Dr. Saravana Kumar – Past President & Executive Co-Chair

Dr. Sai Surender – National Treasurer

Dr. T. S. Srinathkumar – Chair, Academics

Mr. Manickavasagam – Program Coordinator

Their participation in this collaboration reinforces SEMI's academic focus and organizational support for rigorous Life Support training.

Objectives and Structure of the Program

The collaboration primarily focuses on advancing life support and professional practice training through the following modules:

National Basic Life Support (NBLS)

NBLS is a foundational course that equips trainees with essential life support skills, including airway management, cardiopulmonary resuscitation (CPR), and early defibrillation techniques. These skills are crucial for the immediate response required in cardiac or respiratory emergencies.

National Cardiac Life Support (NCLS)

NCLS builds on NBLS by teaching advanced cardiac emergency responses, including algorithm-based advanced resuscitation approaches. It is designed to prepare doctors for critical care interventions in complex cardiac emergencies.

Together, these courses aim to standardize emergency response competencies across postgraduate and super-specialty training programs in the state.

Importance of GCP and GLP Training

In addition to life support programs, this initiative incorporates training in **Good Clinical Practice (GCP)** and **Good Laboratory Practice (GLP)** — critical components of modern medical education that enhance research quality and ethical standards.

GCP ensures clinical research involving human subjects is conducted ethically, that participant safety and rights are protected, and that data are reliable and credible. **GLP** provides a quality framework for non-clinical laboratory studies, ensuring integrity and reproducibility of research outcomes. By integrating GCP and GLP into the curriculum, the program equips students not only with life-saving clinical skills but also with foundational competencies in ethical research conduct and high-quality scientific methodology — preparing them for future roles in clinical practice, research, and evidence-based decision-making.

National Mandates and Training Gaps

In 2021, the National Medical Council (NMC) mandated that all medical students undergo Basic Life Support (BLS) training and that postgraduate students in certain specialties receive Advanced Life Support (ALS) training as part of the medical curriculum. However, implementation has varied widely:

Only a few medical colleges in Tamil Nadu currently have adequate facilities to conduct comprehensive life support training.

Many institutions manage with basic mannequins or limited infrastructure.

To use American Heart Association (AHA) proprietary training modules, colleges must independently procure rights, and students often pay out-of-pocket fees for such certifications.

These limitations have led to uneven exposure and training opportunities for medical students across institutions.

Program Launch and Statewide Implementation

As a key milestone of this collaboration, the first integrated Life Support training program was officially launched on 3rd March 2025. The program was implemented simultaneously across all 8 centres of Tamil Nadu, ensuring entire geographical reach of an uniform training delivery. The centres implementation included:

Chennai, Madurai, Coimbatore, Vellore, Kanyakumari, Melmaruvathur, Thiruvavur, Trichy

This zonal rollout marks a significant step toward decentralized yet standardized emergency training, enabling equitable access to high-quality Life Support education for postgraduate and super-specialty doctors across the state.

Program Launch and study material released by Dr.Narayanasamy.K. Vice Chancellor, The Tamilnadu Dr.MGR Medical University, Guindy, Tamilnadu and Dr.Sowjanya Padipandla, The National President of Society for Emergency Medicine India

The study material for the Basic and Advanced Life support, Good Clinical and Laboratory Practices was formally released by K. Narayana Swamy, Hon'ble Vice-Chancellor of The Tamil Nadu Dr. M.G.R. Medical University, Guindy, along with Dr.Sowjanya Patibandla, National President of Society for Emergency Medicine India, in the presence of the entire SEMI National Board leadership team.

SEMI National leadership board members Dr. Soujanya Padipandla, Dr. Sandeep Gore, Dr. Sai Surendar, Dr. Sweta Tyagi, Dr. Ramyajit Lahiri, Dr. Naga Nischal, and Dr. Ajay K. Misra, joined by SEMI Tamil Nadu board members Dr. Rammohan and Dr. Manzoor, with Dr. Prasanth from the Sri Lankan Society for Emergency Medicine at the inauguration of the BLS/ALS/GCP/GLP program launch.

Decentralized Training Model

To overcome accessibility barriers and improve uniformity, the University has structured the program to conduct BLS, ALS, GCP, and GLP sessions across multiple nodal centres throughout Tamil Nadu. The training was implemented at **eight centres across seven medical colleges under Tamil Nadu Dr. M.G.R. Medical University:**

Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai

Christian Medical College, Vellore

Government Medical College, Coimbatore

Government Medical College, Trichy

Government Medical College, Thiruvavur

Government Medical College, Madurai

Melmaruvathur Medical College, Melmaruvathur

Government Medical College, Kanyakumari

SEMI conducted the program at Tamil Nadu Dr. M.G.R. Medical University, Chennai and coordinated the training across all centres. Participants were provided with dedicated study material covering NBLs, NCLS, GCP, and GLP for reference. Pre- and post-training tests were conducted to measure knowledge acquisition and learning outcomes.

First program on 03.03.2025 at The Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai Campus. SEMI National leadership team members were present at the inaugural program, with program orientation delivered by Dr. Saravanakumar S., Immediate Past President and Executive Co-Chair, SEMI.

Special address by Dr.Srinathkumar.T.S. Academic Chair, SEMI

Proud moment capturing the assessment of program quality and insightful feedback with Dr. K. Narayanasamy, Vice-Chancellor of The Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai, alongside Dr. Siva Sangeetha, University FAC, and Dr. Pushkala, Program Coordinator

This decentralized approach allowed students to train closer to their institutions, minimizing travel burdens and enhancing participation. Training modules were typically delivered over two days per session, making them more feasible for working postgraduate trainees.

Program Take off and Scale

Since its launch on 3rd March 2025, the program has rapidly gained traction and demonstrated remarkable progress. By October 2025 – just eight months after commencement – a total of 4,661 postgraduate doctors have been successfully trained across all centers, reflecting the initiative's strong momentum and wide reach. These figures not only highlight the effective implementation and scalability of the program but also underscore strong institutional engagement and a growing interest among medical students in acquiring competency-based emergency skills that are vital in today's healthcare landscape. The enthusiasm and participation levels witnessed over this short period point to the program's relevance, its alignment with the needs of medical professionals, and its potential to significantly strengthen emergency care capacities nationwide.

Pretest

Since all programs were scheduled to start simultaneously across all centers in Tamil Nadu, a coordinated rollout was achieved to ensure uniform access and participation throughout the state. In alignment with this synchronized launch, a pre-test was conducted for every program by the Society for Emergency Medicine India, leveraging QR code-based assessment technology to streamline the evaluation process and enhance efficiency. By integrating QR codes into the pre-test system, participants at all centers could quickly access and complete the assessment using their mobile devices, fostering a seamless and standardized approach to participant evaluation across the entire program network. This innovative use of digital tools not only facilitated smooth implementation but also ensured consistency in measuring baseline competencies prior to training.

Centralized Delivery of SEMI Lecture Sessions

All SEMI lecture sessions were conducted at The Tamil Nadu Dr. M.G.R. Medical University, Guindy, Chennai, serving as the central venue for this high-impact academic engagement. The choice of this prestigious university provided a unified platform for delivering structured and standardized lecture content to all program participants. This centralized approach ensured that learners from different regions received consistent academic exposure and benefited from focused interactions in an organized academic setting.

The training program commenced with a comprehensive series of Basic Life Support (BLS) lecture sessions, designed to equip participants with essential knowledge and understanding of initial emergency response principles. BLS is a foundational medical intervention that focuses on recognizing life-threatening emergencies such as cardiac arrest, performing high-quality cardiopulmonary resuscitation (CPR), and maintaining airway and circulation until advanced care can be provided. Through structured lectures, participants were introduced to core concepts including the BLS algorithm, the importance of early intervention, and evidence-based strategies for managing critical situations across different age groups. This theoretical grounding ensured that all trainees developed a clear and standardized understanding of lifesaving techniques and the rationale behind them before progressing to practical application.

Following the lecture component, the program moved into hands-on BLS practical training, where participants practiced lifesaving skills under expert guidance. Using simulation manikins and real-time feedback, doctors worked on chest compressions, rescue breaths, barrier devices like bag-valve masks, and appropriate AED use. This experiential training helped build confidence and competence, blending theory with practical ability so participants are well prepared to respond effectively in real emergencies.

Following the completion of the Basic Life Support sessions, the program seamlessly transitioned into the Advanced Life Support (ALS) lecture series, which built upon foundational skills to introduce more complex and critical emergency care concepts. These sessions focused on advanced resuscitation principles, including patient assessment using structured approaches, interpretation of cardiac rhythms, advanced airway management, emergency pharmacology, and coordination of resuscitation efforts in time-critical situations – all of which are essential elements of advanced emergency response beyond basic interventions. ALS training is designed to deepen participants' understanding of patient deterioration, advanced treatment decision-making, and the use of sophisticated clinical techniques that are integral to managing life-threatening conditions effectively.

ADVANCED LIFE SUPPORT - DEMONSTRATION

In conjunction with the lecture components, hands-on workstations were conducted to reinforce theoretical learning through practical application, allowing participants to engage in scenario-based skill stations and workshops under expert supervision. These workstations provided immersive practice in advanced airway procedures, rhythm recognition, defibrillation, intravenous access, and team-based resuscitation exercises, enabling trainees to translate knowledge into action in simulated clinical environments. By integrating structured practical modules with interactive demonstrations, the ALS segment ensured that participants not only absorbed the advanced concepts presented in lectures but also gained confidence and competence in executing complex life-saving techniques — thereby enhancing their readiness to manage real-world critical care situations with precision and teamwork.

After the completion of the life support training modules, the program advanced to Good Clinical Practices (GCP) lecture classes, which provided participants with crucial insights into the ethical, scientific, and regulatory standards governing clinical research and patient care. Good Clinical Practice represents internationally recognized guidelines that ensure the rights, safety, and well-being of research participants are protected, and that clinical data are accurate, credible, and reliable—principles that are foundational to conducting high-quality medical research and clinical trials. During these sessions, trainees were introduced to the history and core principles of GCP, the responsibilities of investigators and research teams, and the ethical frameworks that guide clinical decision-making and documentation. By integrating both theoretical perspectives and real-world examples, the GCP lectures reinforced the importance of ethical practice in all aspects of clinical work and research, further enhancing the participants' preparedness to uphold rigorous standards in their future professional endeavors.

At the end of the theoretical portion of the program, the Good Laboratory Practices (GLP) session was conducted in an engaging and interactive format, allowing participants to actively absorb and apply key concepts related to quality and reliability in laboratory work. Good Laboratory Practices are a set of internationally recognized principles that guide how laboratory studies should be planned, performed, monitored, recorded, and reported to ensure consistency, integrity, and trustworthiness of data.

Core central team coordinated from SEMI - Dr.Saravanakumar.S, Immediate Past President & Executive Co Chair - SEMI, Dr.T.S.Srinathkumar, Academic Chair - SEMI, Dr.Manzoor, Tresurer - SEMI Tamilnadu Chapter, Mr.Manickavasagam, The program coordintor - SEMI, Dr.Venkat, Faculty, Mr.Udhayakumar, Workshop Facilitator

At the conclusion of the training, the results of the centrally conducted post-test demonstrated a significant improvement in participant performance compared to the pre-test assessments, indicating that the training had effectively enhanced the knowledge and skills of the attendees. The comparative outcomes showed marked gains in understanding and application of the program's core competencies, with the overall post-training results being measured as an excellent improvement over baseline levels. These findings reflect the robustness of the curriculum and the quality of instruction provided, underscoring the program's success in achieving its educational objectives and strengthening emergency care capabilities among the participants.

Pre and Post test Results

Among a total of 4,661 participants enrolled for the assessment, 4,603 students successfully attended both the pre-test and post-test, and only these students were considered for comparative analysis. The pre-test results revealed that 6.11% of students scored ≤ 10 and 40.47% were in the 11-15 score range, indicating that a substantial proportion of students initially possessed low to moderate levels of subject understanding, while 53.42% of students scored between 16-19 and none achieved the maximum score of 20. Following the implementation of structured teaching-learning strategies and academic interventions, the post-test results demonstrated a marked improvement in performance, with no students remaining in the ≤ 10 category and only 1.46% scoring in the 11-15 range. Furthermore, 58.22% of students scored within the 16-19 range and a significant 40.32% of students achieved the maximum score of 20, clearly reflecting a substantial upward shift from lower to higher score ranges and confirming the effectiveness of the instructional strategies adopted in enhancing student learning outcomes.

Feedback and Outcomes:

The student feedback collected and analyzed from 4,661 students regarding course content and faculty content delivery reflects a high level of satisfaction among the respondents. A majority of students assigned higher ratings, with 54.4% awarding a score of 5 for course content and 60.6% giving a score of 5 for faculty content delivery. Additionally, a substantial proportion of students rated these parameters with a score of 4, accounting for 38.1% for course content and 32.8% for faculty content delivery. Only a minimal percentage of students provided lower ratings (scores of 1 and 2), indicating negligible dissatisfaction. While the feedback collection also covered hall arrangements and food arrangements, the current report focuses specifically on course content and faculty content delivery. Overall, the results demonstrate that the curriculum design and teaching methodologies adopted by the faculty are both effective and well-received by the students.

- **Article in the International Journal of Research in Medical Sciences:**
- **It is mandatory for all postgraduate students from the 2022 batch to complete this requirement in order to be eligible to appear for the examination.**
- **This requirement will be extended across all specialties and will apply to both undergraduate and postgraduate students**

Short Communication

Skill enhancement for post graduate medical students

ABSTRACT

The medical students ought to be well versed with life saving measures like basic and advanced techniques and should also practice medicine in the most ethical manner in today's healthcare environment. To provide a uniform formal training to all the post graduate medical students it was decided to start the BLS/ALS/GLP/GCP courses across the state using uniform modules developed by experts. To implement this uniformly, The Tamil Nadu Dr. M. G. R. medical university initiated training programs in advanced life support (ALS), basic life support (BLS), and good clinical practice (GCP), good laboratory practice (GLP) through eight designated nodal centres across Tamil Nadu. A total of 4,000 postgraduate medical students received training from qualified personnel. Pre and post training assessments were conducted to evaluate the effectiveness of the program. The feedback collected from students was highly encouraging, indicating a positive reception of the training modules, and reaffirming the program's value and effectiveness.

Keywords: Advanced life support, Basic life support, Good clinical practice, Good laboratory practice

INTRODUCTION

Saving a life is the primary motto of medical fraternity. When any patient encounters a heart attack, there are possibilities of reviving the patient if there is intervention in the golden hour.^{1,2} Medical students should know the exact methodology to execute this like pressure, avoid rib fracture, restoration of airway are few things to be considered.^{3,4}

Stimulation labs provides facilities for students to practice the technique well before the real scenario. This will boost their confidence and also avoid mistakes in real situations.⁵

The national medical council made it mandatory for all the medical students to undergo BLS and advance life support (ALS) training.⁶ Few medical colleges of the state have adequate facilities to conduct the same. Other colleges manage with the primary mannequins. American heart association (AHA) proprietary rights need to be procured

by the colleges to utilize the modules of AHA. All students are not exposed to this important program uniformly.⁷

Cardiac arrest continues to be serious public health concern and one of the leading causes of death globally, despite medical advancements in prevention and care.⁸ Cardiopulmonary resuscitation (CPR) is a critical procedure that supports breathing and circulation during cardiac arrest.⁹ Proper knowledge and training in both BLS and ACLS are key factors that determine the success of resuscitation efforts.^{10,11} As healthcare system advances, simulation-based learning is crucial for equipping students with lifesaving competencies. Simulation based learning using advanced manikins and structured team training significantly strengthens lifesaving skills. It also supports better clinical decision making and improves teamwork during emergency situations.^{12,13}

Leading health organization like the AHA and the world health organization (WHO) continue to emphasize skill based education as a key component of patient safety.^{14,15} The Objective of this training is to offer all the students

under the aegis of this university uniform training by expert faculty.

METHODS

To bring about the uniformity, The Tamil Nadu Dr. M. G. R. Medical University proposed to conduct ALS, BLS and GCP, GLP programs. The university entered a memorandum of understanding (MoU) with society for emergency medicine India (SEMI) and Tamil Nadu apex skill development centre for healthcare to facilitate the training program. These organizations provided trained faculty, technical support, and access to high-fidelity simulation manikins and other training aids to ensure high standards of delivery.

This training program is decentralized into eight nodal centers across Tamil Nadu to enhance accessibility and reduce travel burden for students. Each session included lectures, hands-on simulation training, and team-based learning modules. The modules were designed with a blend of evidence-based protocols and real-time clinical scenarios, ensuring that students could apply theoretical knowledge in simulated emergencies. To maintain consistency and quality across all centres, structured evaluation formats were developed and implemented, along with feedback collection and review by an academic oversight committee. The program commenced on 3rd March 2025, and so far, approximately 4,000 postgraduate medical students have been trained under this initiative.

RESULTS

A total of 4000 postgraduate medical students received structured training from trained personnel over a period of four months. The training was conducted across eight nodal centre established under the aegis of The Tamil Nadu Dr. M. G. R medical university, covering institutions through the state of Tamil Nadu. Pre and post test evaluations was done to assess knowledge gained. All students from two academic batches were successfully trained. Feedback forms were collected from the students provided highly encouraging response, reflecting their appreciation and perceived value of the training. Upon completion, every participant was awarded an e-certificate, which is a mandatory prerequisite for appearing in their university examination.

Figure 1: Response rating the faculty's content.

Figure 2: Response rating the content of the course.

DISCUSSION

The large-scale implementation of skill enhancement programs like ALS, BLS, GCP, and GLP has addressed a critical gap in uniform training across postgraduate medical institutions in Tamil Nadu. The decentralized approach through eight nodal centres ensured accessibility and minimized logistical challenges for students. The encouraging feedback received from the participants highlights the relevance, effectiveness, and quality of the training modules delivered.

By incorporating both theoretical understanding and hands-on simulation, the program effectively bridged the gap between knowledge and clinical application. The mandatory nature of the certificate for exam eligibility also ensured full participation and commitment from students. The success of this initiative reflects the university's commitment to standardized, high-quality skill development and sets the stage for further expansion into allied health sciences and AYUSH disciplines.

CONCLUSION

The structured skill enhancement program initiated by The Tamil Nadu Dr. M. G. R. medical university has successfully addressed the need for standardized training in life-saving techniques and ethical clinical practices among postgraduate medical students. With the training of 4,000 students across eight nodal centres, the program has demonstrated feasibility, effectiveness, and wide acceptance. The encouraging feedback from students reinforces the value of simulation-based, hands-on learning. Recognizing its impact, the university plans to expand the initiative to include paramedical and AYUSH students.
